

Hello, World!

February 14, 2022

I've been working successfully as a software engineer at a variety of companies for 39 years (see resume), and am pretty much burned out from that path as such. I still enjoy software development, but not so much in the increasingly frenetic environment of commercial corporate enterprises. So I'm exploring other opportunities of a rather different nature (and assuming commensurate lesser pay); part-time or full-time.

Though I've no formal credentials working in a university environment or scientific computing, I feel it may be a good fit. My experience has primarily been backend, but I do have experience with frontend development as well. I've worked, to various degrees, with technologies you may be using, e.g. backend and frontend programming in a variety of languages - Java, Kotlin, Node, JavaScript, C, C++, PHP, consuming/creating APIs, Linux, Angular, React, MySQL, Redis, some Solr, Git, general backend tools and UI dashboard development, et cetera.

One of the fondest memories from my career is having worked at MIT Lincoln Laboratory, a more academic setting (than all my other jobs), where I had the opportunity to work with and help out people much smarter than me, in a more creative and less profit-driven environment; I imagine this position at Northeastern, in a university setting, might be more like that, a welcome change of pace, and possibly mutually beneficial.

Thanks for your time. David.
