

Hello, World!

January 22, 2022

I've been working successfully as a software engineer for 39 years (see attached resume for some details), and am pretty much burned out and ready to retire from that profession as such. I still enjoy software development, but not so much in the increasingly frenetic environment of commercial corporate enterprises. So I'm exploring other opportunities of a rather different nature (including commensurate less pay); part-time or full-time.

Though I've no formal work/academic credentials in the library sciences, it's something that does interest me; and I've certainly been a consumer of libraries; and have had a fairly wide variety of experience in computer software systems; and I'm an active reader and think I'm relatively literate in general.

I do have experience with, to various degrees, many of the kinds of specific technologies listed in the job qualifications, e.g. frontend and backend programming in a variety of languages, consuming and creating APIs (REST/SOAP), JavaScript, Node.js, React, Angular, HTML/CSS, XML, XSLT, JSON, SQL and relational databases (e.g. MySQL), working with large data sets, Linux, Bash, and other command-line tools, Git, Nginx, et cetera.

One of the fondest memories from my career is having worked at MIT Lincoln Laboratory, a more academic setting (than all my other jobs), where I had the opportunity to work with and help out people much smarter than me, in a more creative and less profit-driven environment; I imagine this Systems and Applications Development Librarian position, in a university setting, might be more like that, a welcome change of pace, and possibly mutually beneficial.

Thanks for your time. David.
